A Garden Application

PROJECT SYNOPSIS *In this console application, it will be an attempt to create a growing application/garden/game application. In these applications, they will have a player to select the seeds grow and in time if when needed to water or tend the plant, they will need to deal with those factors to gain profit for their harvest.*

DESCRIPTION OF SKILLS *From what I read, I seen that there is two applications to be created. One in C# and the other in JavaScript. The way I'll be creating this is in Visual Studios and Visual Studio Code. I'll be using object oriented syntax to best handle constructing the data being created. I'll further document my code base work by using Git and Github. I'll track my progress by using the Kanban board in Github to further follow through what is being done.*
